

PAPILLA SEAL

SEALANT FOR DRY DAIRY COWS

Basic ingredients:

Natural origin beeswax; propylene glycol; cucumber glycol extract; vegetable glycerol.

Preservative: colloidal silver (SynthAg).

FOR VETERINARY USE ONLY

Indications

Prevention of ascending intramammary infections during the dry period.

Contraindications and Secondary Effects

Do not use the product alone in cows presenting sub-clinical or clinical mastitis during the dry period. Do not use during lactation.

Method of use

Intramammary use. Infuse the contents of one syringe of product into each quarter of the udder immediately after the last milking (at the time of drying). Do not massage the teat or udder after infusion of the product. It is essential that the teat is thoroughly cleaned and disinfected with suitable products. Allow the teat to dry before infusion. Avoid contaminating the syringe nozzle. After infusion, it is advisable to use a suitable nipple disinfectant dip or spray.

How to store the product

No special storage precautions.

Warnings

Use the syringe only once. After dispensing the product, do not administer any other intramammary products. In cows that may have sub-clinical mastitis, the product may be used after administration of a suitable antibiotic treatment for dry cows in the infected quarter.

Waiting time

Meat, viscera: zero days. Milk: zero hours

Product Destination Species

Cattle (dairy cattle).

Interactions with other veterinary medicinal products

No incompatibilities were found in clinical trials. Notify your veterinarian if an incompatibility is detected.

Undesirable effects or side effects

None known.

Use in Pregnancy and Lactation

Pregnancy: Since the product is not systemically absorbed after intramammary infusion, it may be used in pregnant animals. At calving, the plug may be ingested by the calf. Ingestion of the product by the calf is safe and produces no adverse effects.

Format

Contents of Papilla Seal bucket: 180 5g syringes
